Web development final exam

Name: Gael Larue

Project name: Grand horizon hotel

URL: http://localhost/hotel-registration/

VS code was used as the main code editor for the website. The programming languages used were html, php, javascript and css. I used MySQL for the database, XAMPP for localhost and I uploaded the project to Github.

The main function of the website is to allow online booking of rooms for a hotel. When you enter the website you will be met with the home page which displays the name of the hotel and show's a picture of it. You can use the register option from the nav bar to sign up for the website.

Once logged in, you will have the option to make a room reservation, which allows you to choose the date of check in and check out and select the amount of people who will be staying. You can also send a message to the hotel via the contact section of the website to address anything.

Writing the html, php, css and creating the database were done notably well. I did have some difficulties however connecting the MySQL database to the website but I managed to overcome it.
